

**Material design hint**

**Continue**

Textinputlayout material design hint. Material design hint color. Material design remove hint. Material design hintassist. Angular material design hint. Material design floating hint text box. Wpf material design hint.

In this tutorial, we'll implement Text Fields using the new Material Design Components Library. We have already implemented TextInputLayout here. Material TextFields TextInputLayout provides an implementation for Material text fields. We just need to use TextInputEditText! First and foremost, import the new material components dependency. Also, set the MaterialComponent theme in your Activity. implementation 'com.google.android.material:material:1.1.0-alpha09' By default, an input text field has a filled background to draw users attention. Now let's create a default text field: In the next few sections, we'll customize text fields in different ways. Standard and Dense Text Fields Text Fields have two types of height variants: Standard - This is used by default if nothing else is there. Dense - @style/Widget.MaterialComponents.TextInputLayout.FilledBox.Dense The dense Text field is slightly shorter in height. By default the FilledBox.Standard style is used app:boxBackgroundColor is used to set the filled box color. Here's how this looks on the screen: Android Material Text Field Dense Standard Filled Box Outline Box Text Fields Apply the following style on the TextInputLayout to get the outlined look text fields: style="@style/Widget.MaterialComponents.TextInputLayout.OutlinedBox" Similar to FilledBox, this has the two height variants as well - Standard and Dense. To set the corner radius, following attributes are used: boxCornerRadiusTopStart boxStrokeRadiusTopEnd boxCornerRadiusBottomStart boxCornerRadiusBottomEnd boxStrokeColor is used to set the stroke color of the outline. Here's how it looks: Android Material Text Field Outlined Box End Icon Modes Moving forward, now let's set end icon modes. These are basically icons set at the right of the text field. Currently, the three types of icons that are available built-in are - password toggle clear text custom The above attributes are self-explanatory. We can set our own icon tint on these icons using endIconTint attribute. For the custom icon, we use the endIconDrawable attribute Here's how it looks on the screen: Android Material Text Field End Icons For the custom icon, we can use setEndIconOnClickListener callback to listen to clicks and do stuff. Shaped Text Fields ShapeAppearance is a powerful style. It lets us customize the shape of the text field. We have two built-in shapes - cut and round. cut 12dp rounded 16dp Setting the above styles in the shapeAppearance attributes gives us this - Android Material Text Field Shapes That sums up Material Components Text Fields for now. In the below source code you'll find all the above concepts. AndroidMaterialTextFields Github Project Link Join our DigitalOcean community of over a million developers for free! How to achieve creating the OutlinedBox with the hint on the top left frame rather than inside the box? Have spent the entire morning unsuccessful. What I want is this: My gradle: implementation 'androidx.appcompat:appcompat:1.1.0' implementation 'com.google.android.material:material:1.1.0' My app Theme: style name="AppTheme" parent="Theme.MaterialComponents.Light.NoActionBar" My layout: My result (the frame is continuous, without the hint embedded in the top left corner): 6 Ajude a traduzir esta páginaCampos de texto permitem que os usuários digitem e editem texto. Campos de texto permitem que os usuários insiram texto em uma interface de usuário. Eles geralmente aparecem em formulários e diálogos. FeedbackTamanho do pacoteMaterial DesignFigmaAdobeSketchThe TextField wrapper component is a complete form control including a label, input, and help text. It comes with three variants: outlined (default), filled, and standard. Os atributos são suportados pelo TextField, como por exemplo required, disabled, type, etc. assim como o helperText que é utilizada para dar contexto sobre um campo de entrada, tais como, a entrada que será usada. Propriedades de formulárioStandard form attributes are supported e.g. required, disabled, type, etc. as well as a helperText which is used to give context about a field's input, such as how the input will be used. The error prop toggles the error state. The helperText prop can then be used to provide feedback to the user about the error. The multiline prop transforms the text field into a TextareaAutosize element. Unless the rows prop is set, the height of the text field dynamically matches its content (using TextareaAutosize). You can use the minRows and maxRows props to bound it. The select prop makes the text field use the Select component internally. Há muitas formas de incluir um ícone com um campo de texto. A forma principal é utilizando um componente InputAdornment. This can be used to add a prefix, a suffix, or an action to an input. Por exemplo, você pode usar um botão com ícone para ocultar ou revelar a senha. Gosta mais de campos de texto menores? Use a propriedade size. A altura do campo na variante filled pode ser reduzida ainda mais ao renderizar o rótulo fora dele. The margin prop can be used to alter the vertical spacing of the text field. Using none (default) doesn't apply margins to the FormControl whereas dense and normal do. A propriedade fullWidth pode ser usada para fazer com que o campo ocupe a largura total de seu contêiner. O componente pode ser controlado ou não controlado. TextField is composed of smaller components ( FormControl, Input, FilledInput, InputLabel, OutlinedInput, and FormHelperText ) that you can leverage directly to significantly customize your form inputs. Você também pode ter notado que algumas propriedades de campo nativas do HTML input estão faltando no componente TextField. Isto é intencional. The component takes care of the most used properties. Then, it's up to the user to use the underlying component shown in the following demo. Aínda, você pode usar inputProps (inputProps e inputLabelProps) se você quiser evitar algum boilerplate. Campos A propriedade color altera a cor do destaque do campo de texto quando focado. Aqui estão alguns exemplos de customização do componente. You can learn more about this in the overrides documentation page. Customization does not stop at CSS. You can use composition to build custom components and give your app a unique feel. Below is an example using the InputBase component, inspired by Google Maps. If you are looking for inspiration, you can check MUI Treasury's customization examples. useFormControlFor advanced customization use cases, a useFormControl() hook is exposed. This hook returns the context value of the parent FormControl component. API import { useFormControl } from '@material-ui/core/FormControl'; Retornos value (object): value.adornedStart (bool): Indicate whether the child Input or Select component has a start adornment. value.setAdornedStart (func): Setter function for adornedStart state value. value.color (string): The theme color is being used, inherited from FormControl color prop. value.disabled (bool): Indicate whether the component is being displayed in a disabled state. value.error (bool): Indicate whether the component is being displayed in an error state. value.inheritedFrom FormControl error prop value.filled (bool): Indicate whether input is filled value.focused (bool): Indicate whether the component and its children are being displayed in a focused state value.fullWidth (bool): Indicate whether the component is taking up the full width of its container, inherited from FormControl fullWidth prop value.hiddenLabel (bool): Indicate whether the label is being hidden, inherited from FormControl hiddenLabel prop value.required (bool): Indicate whether the label is indicating that the input is required input, inherited from the FormControl required prop value.size (string): The size of the component, inherited from the FormControl size prop value.variant (string): The variant is being used by the FormControl component and its children, inherited from FormControl variant prop value.onBlur (func): Should be called when the input is blurred value.onFocus (func): Should be called when the input is focused value.onEmpty (func): Should be called when the input is emptied value.onFilled (func): Should be called when the input is filled Exemplo O rótulo do campo no estado de "shrink"(recuo) nem sempre está correto. O rótulo do campo deve recuar assim que o campo estiver exibindo algo. Em algumas circunstâncias, não podemos determinar o estado de "shrink" (input numérico, input datetime, input Stripe). Você pode notar uma sobreposição. Para contornar o problema, você pode forçar o "shrink" do rótulo, ou Contagem Rótulo flutuanteThe floating label is absolutely positioned. It won't impact the layout of the page. Make sure that the input is larger than the label to display correctly. type="number"Campos com types="number" tem problemas potenciais de usabilidade: Allowing certain non-numeric characters ('e', '+', '-', ':', ',') and silently discarding others A funcionalidade de rolagem para incrementar/decrementar o número, pode causar alterações acidentais difíceis de notar e muito mais - consulte este artigo da equipe GOV.UK Design System para obter uma explicação mais detalhada. Para validação de número, uma alternativa viável é usar o padrão de campo type="text", com o atributo pattern, por exemplo: No futuro, pretendemos fornecer um componente de campo número. Texto auxiliarA propriedade de texto auxiliar afeta a altura do campo de texto. Se dois campos de texto forem colocados lado a lado, um com um texto auxiliar e outro sem ele, terão alturas diferentes. Por exemplo: Isso pode ser corrigido passando um caractere de espaço para a propriedade helperText: Você pode usar bibliotecas de terceiros para formatar um campo. Você precisa fornecer uma implementação personalizada do elemento com a propriedade InputComponent. A seguinte demonstração usa as bibliotecas react-text-mask e react-number-format. O mesmo conceito pode ser aplicado para, p. ex. react-stripe-element. O componente de entrada fornecido deve expor um ref com um valor que implemente a seguinte interface: interface InputElement { focus(): void; value?: string; } const MyInputComponent = React.forwardRef((props, ref) => { const { component: Component, ...other } = props; React.useImperativeHandle(ref, () => ({ focus: () => { }; })); return ; }); ; AcessibilidadePara que o campo de texto seja acessível, o campo deve estar vinculado ao rótulo e ao texto auxiliar. Os nós DOM subjacentes devem ter essa estrutura: Endereço de e-mail Nós nunca compartilharemos seu e-mail. If you are using the TextField component, you just have to provide a unique id unless you're using the TextField only client side. Until the UI is hydrated TextField without an explicit id will not have associated labels. If you are composing the component: Endereço de e-mail Nós nunca compartilharemos seu e-mail. Projetos ComplementaresFor more advanced use cases, you might be able to take advantage of: The component also comes with an unstyled version. It's ideal for doing heavy customizations and minimizing bundle size. API
